
Every major problem facing humanity is exacerbated by a needlessly ballooning human population. So why is the explosive growth of the human family—more than sevenfold since the Industrial Revolution and still expanding rapidly—generally ignored by policy makers and the media? And why has the environmental movement chosen to be mute about the fundamental driver of species loss and the destruction of wildlife habitats around the globe? Isn’t it time to start speaking out about the equation that matters most to the future of people and the planet?

Overpopulation + Overdevelopment = Overshoot

Overdevelopment, Overpopulation, Overshoot ("OVER") moves beyond insider debates and tired arguments (human numbers and overconsumption are both responsible for the crisis of population overshoot). Anchored by a series of provocative photo essays, OVER presents the stark reality of a world transformed by human action, action that threatens our future and the buzzing, blossoming diversity of life with which we share the planet.
OVERDEVELOPMENT
OVERPOPULATION
OVERSHOOT
To the wild beauty, ecological richness, and cultural diversity being swept away by the rising tide of humanity…

and for William R. Catton Jr., peerless teacher on the perils of overshoot.
Can you think of any problem in any area of human endeavor on any scale, from microscopic to global, whose long-term solution is in any demonstrable way aided, assisted, or advanced by further increases in population, locally, nationally, or globally?

—Albert Bartlett
WE ARE ONE HUMAN RACE living on one planet. We aspire for the same things: food, water, good health, and most of all dignity and loving relationships. We yearn for opportunity, voice, and resources to develop our potential. We want to raise our children in a safe and healthy environment. We want to experience the Earth’s beauty and natural bounty.

Realizing our common humanity invites us to embrace common responsibility and to care for one another and the planet on which we live. The emergence of such grave global challenges as biodiversity loss and climate change demands our urgent and undivided attention. The health of the oceans, the air, the water, and the land affects human health. The size of the human family and the way that we live influence the quality of life for people today as well as for future generations. Moreover, our numbers and behavior profoundly affect nonhuman species, all of the creatures with which we share this beautiful but finite planet. The web of life that these species create is what makes the Earth habitable and lovely.

We know that rapid population growth exacerbates social, economic, and ecological problems—whether in rich or poor countries, north or south. Most important, rapid population growth is a fundamental driver of individual as well as societal problems that deny dignity, especially to women who bear the burden of reproduction and caretaking of communities. We have the knowledge to reduce these burdens thoughtfully by using rights-based, culturally appropriate ways to slow population growth while enhancing human dignity and thoughtful development. Taking action in this way is important for my country, Kenya, as it is for all other nations. This is what the world needs to do today and not tomorrow.

This urgency strikes home when looking through the images in this powerful book. Who can say, with an honest heart, that the suffering of the Earth and millions of her children is not linked to the exponential growth in human numbers?

I have devoted most of my professional life to advocating for and advancing the universality of human rights, the rights of women and girls, and the rights of poor people. I am not naïve about either the complexity of factors affecting public policy, or about the imbalance of power, voice, and resources across nations, genders, generations, and cultures. Yet, I sincerely believe that family planning is a human right that yields multiple benefits for women, children, and poor people—ultimately for all humanity. It helps sustain a mother’s health and gives women choices beyond childbearing. Well-spaced children are healthier, and fewer children per family help their parents to better support their growth and development. All these step-by-step and one-person-at-a-time actions add up to immense social good when implemented on a large scale.

The core ethic that unites all of us in relation to family planning is a respect for individual autonomy. Family planning is not about telling people what to do but about listening to what they want. Over 200 million couples around the world want to limit the number of children they have, but are not using contraception, and every woman wants and deserves a safe delivery. A safe and legitimate way to reduce population growth is to make family planning information and services and access to safe motherhood universally available in a human rights framework.

While the complexities and challenges of achieving this are quite real, the problem of rapid population growth requires that leaders gather collective political will and implement effective policies with the speed and commitment of resources commensurate with
Some good practices are happening. There is global momentum promoting and investing in girls’ education and protection from harmful practices such as child marriage. Despite pockets of distractors, such as the Boko Haram in Northern Nigeria or the Taliban in Pakistan that want to hinder this progress, we must commit to giving the next generation the opportunities to fulfill their dreams. Moving toward that future is a shared responsibility and one that cannot be limited by geography or politics.

All of these things are possible when individuals, families, governments, and international development organizations work cooperatively and quickly to make family planning education and services universally available, moving toward ensuring total equality of opportunity for girls and women, and when everyone works toward narrowing the economic gaps between nations.

These times call for an unprecedented level of cooperation and common purpose among genders, cultures, peoples, and nations. The legacy for future generations and so much of Earth’s living heritage depends on who we are living today. Our problem is not ignorance. We are drowning in knowledge. Perhaps we lack discernment or else we simply are too selfish to care for the future of those to come after us! But indeed, the world community can—and act quickly—when faced with major threats. Now is the time to take the problem of overshoot seriously and to act while we still have an opportunity to ensure that future generations inherit a sustainable world.

Today we are faced with a challenge that calls for a shift in our thinking, so that humanity stops threatening its life-support system. We are called to assist the Earth to heal her wounds and in the process heal our own—indeed to embrace the whole of creation in all its diversity, beauty, and wonder.

—Wangari Maathai
A PARABLE...

LORD MAN
In the beginning the world was whole, and beauty prevailed . . .
Life begetting life, until the waters, then the lands, were filled with creatures.
Myriad were their languages, from the nearly imperceptible song of moss to the bugling of elk. Whales performed their symphonies in the deep. The sounds of life were everywhere. Life pulsed and contracted and flourished through the ages.
Eventually, a being appeared who learned to speak and count. For millennia he lived well among his wild kin.

But as his cleverness grew, so did his ambitions, until the day he declared himself ruler of all.
Believing the self-deception that his kind was sovereign over the others, he taught his children that the Earth had been made for Man’s use and profit. He no longer recognized his neighbors in the community of life, instead calling them “natural resources.”
The old religions, which had long tied the human tribe to the other creatures in a circle of reciprocity, were forgotten.

His work he named “progress.”
Feigning himself Lord Man, he grew ever-more clever. He learned to gather and burn fossil fuels made by ancient geological forces.

Praise was sung incessantly to the new god, Growth.
As the multitudes spread across the face of the Earth, the songs of the other creatures grew fewer and fainter. His numbers became multitudes.
Many voices went permanently quiet, replaced by the sounds of machines—digging, churning, scarring the land, driving the whales crazy with the noise.
The seas were emptied of fish and filled with garbage. Every day the Earth became poorer. Bit by bit, it was transformed by Lord Man’s numbers and actions.
The prairies were transformed into feeding factories for the ever-expanding human masses. The trees were replaced by bleeding stumps.
The world was whole, and beauty prevailed. Smokestacks darkened the skies. No place was sacred, no landscape safe from the insatiable creature's thirst for more energy to serve his God of Growth.
Lord Man tamed rivers, split atoms, decapitated mountains, and stabbed the Earth everywhere he thought she might offer a vein of fuel.
When the feverish Earth cried out, sending furies to communicate her distress,

Lord Man ignored her sickness until it could no longer be denied.
Slowly, the scales began to fall from his eyes when he saw famine ravage the land. When he saw precious sources of fresh water disappear.
When the longing that gnawed on his spirit made him recall so many creatures that had passed into oblivion.

Seeing the effects of his hubris, he began to wonder if his empire was secure.
His delusion weakened just enough to reveal the choice before him:

Two paths, one leading to abundant Earth, filled with birdsong:
Would he restrain his numbers and rejoin the community of life as plain member and citizen? Or the way of Growth—offered riches for some, misery for many, and ultimate destruction for all his tribe.
Or attempt to engineer all the Earth to his will, heeding only the call of More?
Most conversations about population begin with statistics—demographic data, fertility rates in this or that region, the latest reports on malnutrition, deforestation, biodiversity loss, climate change, and so on. Such data, while useful, fails to generate mass concern about the fundamental issue affecting the future of the Earth.

In reality, every discussion about population involves people, the world that our children and grandchildren will live to see and the health of the planet that supports all life. In my roles as president of Population Media Center and CEO of the Population Institute, I spend most of my time in developing countries, where many of my friends and acquaintances are educated and prospering. But I also know individuals who are homeless, unemployed, or hungry. The vast majority of people in these societies, regardless of their current status, do not enjoy a safety net. They live from day to day in hopes that their economic circumstances will improve. Abstract statistics on poverty are irrelevant to families struggling to secure the food, water, and resources needed to sustain a decent life.

Those who blithely dismiss the challenges posed by population growth like to say that we could physically squeeze 7 billion people into an area the size of Texas. They don’t stop to consider the suffering already caused by overpopulation. The population debate is not about the maximum number of people that could be packed onto the planet. The crucial question is: How many people can the Earth sustain, at a reasonable standard of living, while leaving room for the diversity of life to flourish? There is no precise answer to this question, but the facts overwhelmingly support one conclusion: We cannot go on the way we are going. We are already doing severe and irreparable harm to the planet. Something has to give.

If we cannot live sustainably with 7.2 billion people, how are we going to support billions more by the end of this century? The United Nations’ latest “medium-variant” projection indicates that we could have 10.9 billion people by 2100, but that may be an underestimation. Fertility rates in many parts of the world are not falling as fast as previously anticipated. In some countries, both developed and developing, fertility rates are actually on the rise again. In 2014 the global total fertility rate—the average number of children born to each woman during her lifetime—was 2.5. If this rate were to remain unchanged, demographers suggest that we could have 27 billion people on the planet by the end of the century. Given our limited inheritance of soil, water, and arable land, sustaining a global population of that size is not even remotely possible.

As vividly illustrated by this book, human numbers and activity are already destroying the planet’s ecological integrity—running roughshod over myriad other species. But it’s not just the environmental damage we’re inflicting that should concern us. Equally appalling is how our actions threaten humanity’s future prospects. We have passed a crucial tipping point. Our quest for greater and greater material prosperity is now impoverishing future generations. The Global Footprint Network estimates that humans already use 150 percent of the Earth’s renewable capacity annually, and it estimates further that by 2030 we will need “two planets” to sustain us. Further growth simply deepens the crisis of ecological “overshoot” as we draw down Earth’s carrying capacity, and it comes at the direct expense of our own children and grandchildren. Is that any kind of way to behave?

If you care about people, you must care about what we are doing to the planet. If you care about what we are doing to the planet, you must also care about human numbers. Given a planet with infinite space and resources, population growth could, arguably, be a blessing. We do not live on such a planet. However, there was a time when the Earth and its resources appeared boundless. Some people still adhere to that anachronistic belief. If nothing else, the photographs in this book should shatter that illusion.
Many of us today do recognize that the Earth and its resources are limited, yet too many people still cling to the notion that modern science and technology will enable us to defy physical limits. In the Middle Ages, alchemists sought in vain for a “philosopher’s stone” that would convert base metals into gold. They never succeeded. Why? Because what they were looking for did not, and could not, exist, because its existence would have violated the physical laws governing the universe.

Modern-day alchemists are trying to find ways of sustaining perpetual growth in a finite and increasingly resource-constrained world, searching for a scientific or technological breakthrough that will enable us to keep growing indefinitely. Like the philosopher’s stone, it does not exist. Our faith in breakthroughs is misplaced, as amply demonstrated by the past three hundred years of scientific and technological advances that have accelerated, not slowed, the degradation of the natural world. Even if scientists were to develop a relatively cheap, abundant, and clean form of energy that powered continuous economic and population growth, it would only accelerate the rate at which humanity is destroying the ecological systems that make the planet habitable. In the meantime, while we are waiting for magical breakthroughs, we are in a headlong race to extract and consume fossil fuels at whatever the cost to the Earth. Scientists warn that we will fly the planet if we burn all the world’s known reserves of coal, gas, and oil, but that concern has not slowed the relentless exploration for more fossil fuels. An ever-expanding global population is increasing fossil fuel demand for products and services, making humanity’s hunger for fossil fuels utterly insatiable.

Some cling to the notion that we can achieve sustainability by reducing consumption in the overdeveloped world. As moribund as that idea may be, it has no critical mass of support. While most of us would like to see lower living standards in the overdeveloped world, where the per capita consumption of resources is so much greater, Nearly half of all pregnancies in the United States are unplanned, and while America’s teenage pregnancy rate is declining, it remains the highest among industrialized nations. Shockingly, several state legislatures in recent years have slashed support for family planning, resulting in dozens of clinics having to either close their doors or limit services.

It is therefore critical that we focus on addressing population growth in the developing world, where the per capita consumption of resources is so much greater. Nearly half of all pregnancies in the United States are unplanned, and while America’s teenage pregnancy rate is declining, it remains the highest among industrialized nations. Shockingly, several state legislatures in recent years have slashed support for family planning, resulting in dozens of clinics having to either close their doors or limit services.

A growing number of people want to expand their ecological footprint through additional consumption. Much of humanity, of course, desperately needs a larger share of Earth’s resources. More than 2 billion people in the world live on less than $2 per day. Nearly a billion people go to bed hungry every night. About half the people in the world do not have access to toilets or other means of modern sanitation. I do not know of anyone who would deny these people a better quality of life, but if world population continues to grow as currently projected, many, if not most, of these people will never have their most basic needs realized, let alone fulfill their aspirations. The world is not that bountiful. I wish it were, but it is not. If we have any hope of bringing about a genuine balance between what humans demand of nature and what nature can reasonably provide for humanity, we must take crucial steps. Starting with the first step, we must devote more resources to preventing unplanned pregnancies through expanded access to contraceptives. Women everywhere should have the means to time, limit, or space their pregnancies. But greater access to contraceptives alone will not suffice. In those countries where population growth is most rapid today, girls and women lack reproductive choices; they live in traditionally male-dominated societies where large families are still the norm. Large-family norms, misinformation, and cultural barriers account for most decisions to not use contraception. If we do not enable girls to remain in school and delay marriage until adulthood, provide accurate information, and empower women in the developing world, then we will have failed countless individuals. Moreover, in the face of this humanitarian fiasco, fertility rate declines may continue only very slowly, or not at all—but certainly not fast enough to avoid the kind of human suffering that results when countries are overpopulated.

In many parts of the world, child marriage is still prevalent. It is estimated that some 14,000 girls become child brides each day. In some areas, particularly poor rural communities, parents require their daughters—who have not yet reached puberty—to wed men who are twice or three times their age. Child brides do not enjoy reproductive choice in any meaningful sense. Most are condemned, if they survive childbirth, to having many children, and their families are condemned, in turn, to a life of continued poverty and deprivation. As important as it is to reduce unplanned pregnancies in the developing world, it is just as important to do so in the overdeveloped world, where the per capita consumption of resources is so much greater. Nearly half of all pregnancies in the United States are unplanned, and while America’s teenage pregnancy rate is declining, it remains the highest among industrialized nations. Shockingly, several state legislatures in recent years have slashed support for family planning, resulting in dozens of clinics having to either close their doors or limit services.

These individual and community-level actions, in aggregate, have global consequences. The leading scientists of the world are concerned that we are approaching as many as nine planetary tipping points, which, if surpassed, would cause irreparable harm to the environment and the well-being of future generations. We have already crossed one boundary in terms of greenhouse gas emissions; the climate is changing, and we have already inflicted incalculable harm on posterity as a result.

Because of population growth and changing diets, the world’s demand for food is projected to rise by 70-100 percent over the next forty years. No one knows how we will meet that demand. Cultivated farmlands already occupy a land mass the size of South America, and ranchlands used for livestock grazing occupy a land mass the size of Africa. There’s very little arable land left; most of it is in the form of tropical forests, which if cut down to expand agriculture would accelerate biodiversity loss and further complicate efforts to rein in greenhouse gas emissions.

Water scarcity in many parts of the world has already reached crisis proportions. Demand for water is expected to outstrip supply by 40 percent within the next twenty years. As one research organization put it, we will need the equivalent of 20 Nile Rivers—which we do not have—to meet demand. By 2030, an estimated 3.9 billion people, nearly half the world’s population, will be living in areas of high water stress.

We live today in a “Catch 22” world, where addressing one urgent problem often exacerbates another. If we double food production to feed a growing world, we expand greenhouse gas emissions. If we discover and exploit more fossil fuels, we fry the planet. If we reduce our water consumption, we curtail our food production. If we grow the world’s middle class, we increase the pressure on Earth’s natural ecosystems.

There is, however, one exception to our “Catch 22” world, and that concerns population. Viewed from almost any angle, addressing population is a win-win proposition. By empowering girls and women in the developing world and expanding family planning services and information everywhere, we produce a world of good: Fertility rates decline; maternal and child health improve; food security increases; poverty decreases; education and economic opportunities expand; and degradation of the environment is curtailed.

In discussions about family planning and its many benefits, the health of nature is often an afterthought. Far too often it is overlooked entirely. We tend to see the well-being of people as somehow distinct from the well-being of the Earth. Some even see the environment as being in “competition” with humans. The obvious truth, although unacknowledged by some, is that we are not separate or distinct from nature. Our hopes and our fate are inextricably linked to the fate of the natural world. We are part of a complex web of interdependent life, and our welfare depends upon the health of the whole. When life took hold on this planet it produced millions of species that have lived and evolved and produced both wondrous beauty and diversity. We modern humans are both products of and beneficiaries of that evolutionary process.

We are, however, acting as ungrateful beneficiaries. Scientists tell us that we are exterminating our fellow plant and animal species...
and meet the economic aspirations of an additional 3 or 4 billion
people moving forward. As well illustrated by the photographs in
this book, that line of thought reflects the worst kind of wishful
thinking. Our 7.2 billion on the planet are already doing grave
harm to the biosphere. Several decades ago, a cartoon character
named "Pogo" made popular the oft-quoted saying "We have
met the enemy and he is us." We might say this today in regards
to the challenge the world faces, only it's not a comic matter. If
we are to reduce severe poverty, defeat hunger, and bring about
a sustainable world, we must achieve change on a global scale,
beyond just our consumption habits, and that change must begin
with us. This conviction led me to work for the Population Institute
more than forty years ago and subsequently, spurred me to
establish the Population Media Center fifteen years ago.

Despite the widespread belief that simply making contraceptives
more widely available can stabilize world population, there are
other reasons why women in the developing world end up having
more children than they might otherwise desire, as revealed
through the Demographic and Health Surveys supported by
USAID (United States Agency for International Development).
In reality, many of these women have no reproductive choice. Child
brides often have nothing to say about how many of their own
children they will have or when. Some women abstain from using
contraceptives because of misinformation or blatant lies about
the possible side effects or risks of using modern methods of
contraception. Still other women have more children than they
want because of fatalism, or religious teachings, or insistent in-
laws who want more grandchildren.

WHILE THE OBSTACLES

Before humanity are real, we should
be careful not to overestimate the difficulty of following the
path of the United Nations' lowest population projections, which
show a possible global stabilization as soon as the year 2050.
Achieving this stabilization is a challenge, but it is far from an
insurmountable one. The United Nations estimates that it would
cost an additional $3.5 billion per year to provide contraceptive
information and services to the more than 200 million women
in the developing world who want to avoid a pregnancy but who
are not using a modern method of contraception. (That's less
than 4 percent of what Americans spend on beer each year.) That's
a very small price to pay for a more sustainable world.

At the Population Media Center (PMC) we create long-running
serial dramas (soap operas) that serve to educate women about
their contraceptive choices. Using a methodology based upon the
'social learning' theories of the great Stanford psychologist Albert
Bandura and the programs developed by Miguel Sabido, the vice
president of Telefónica in Mexico, we work with irrigation teams
to develop long-running dramas, generally broadcast via radio,
that provide positive role models for men and women in the developing
world. Our listening audiences learn from popular "transitional"
characters who are torn between good and bad influences. In the

As a young man, after earning undergraduate and graduate
degrees in biology with a specialization in ecology and evolution,
my interest in moths and butterflies was so strong that I seriously
considered becoming a lepidopterist. Many of the species that
pique my interest as a college student are now in danger of
terminating extinction. Even the common Danaus Plexippus, otherwise
known as the monarch butterfly, is fast approaching endangered
status. Its winter habitat in Mexico has shrunk dramatically.

As a young man, after earning undergraduate and graduate
degrees in biology with a specialization in ecology and evolution,
my interest in moths and butterflies was so strong that I seriously
considered becoming a lepidopterist. Many of the species that
pique my interest as a college student are now in danger of
terminating extinction. Even the common Danaus Plexippus, otherwise
known as the monarch butterfly, is fast approaching endangered
status. Its winter habitat in Mexico has shrunk dramatically.

Biologists warn that herbicide use is decreasing availability of the
milkweed plants, limiting a primary food source for monarchs and
thus diminishing their numbers.

At the Population Media Center (PMC) we create long-running
dramas, generally broadcast via radio, that
show a possible global stabilization as soon as the year 2050.
Achieving this stabilization is a challenge, but it is far from an
insurmountable one. The United Nations estimates that it would
cost an additional $3.5 billion per year to provide contraceptive
information and services to the more than 200 million women
in the developing world who want to avoid a pregnancy but who
are not using a modern method of contraception. (That's less
than 4 percent of what Americans spend on beer each year.) That's
a very small price to pay for a more sustainable world.

While I am deeply concerned about the future of humanity and the
planet, I'm not a pessimist. It's not too late. There are things
that we can do to achieve a harmonious world and many of
the steps that are required, like PMC's radio programs, do not
require an enormous investment of resources. Time, however,
is beginning to run out.

Given the central role that population dynamics will play in
determining the welfare of future generations, what the world
needs today is a wake-up call. This book is that wake-up call.
The photographs to follow are emotionally jarring. The sights
expressed herein are not reassuring; they are deeply provocative.
But that is the nature of wake-up calls. The way that human
numbers and behavior are transforming the Earth, undermining its
ability to support the human family and the rest of life, is apparent
for all to see. The reality of this urgent moment calls us to think,
to care, and to act.
With a present human population that has surged past 7 billion and is growing fast, most people assume that rapid population growth is normal. It’s not. During almost all of human history, our numbers have been either stable or growing imperceptibly (less than 1/500th of 1 percent according to a leading demographer). Population growth ticked up significantly after the invention of agriculture, but the rate of increase was still only a small fraction of 1 percent. Then, around the start of the Industrial Revolution some two centuries ago, a convergence of factors set the stage for a demographic explosion. Most notably, humans began to exploit the vast fossil-energy storehouse laid down by ancient geological forces—coal, oil, and natural gas. The modern era’s exploitation of this energy windfall has coincided with a suite of rapid advances in agricultural productivity, science, and medicine that have lowered death rates and increased life spans, leading to ballooning human populations around the globe.
Neither prosperity nor a just and egalitarian social order can by themselves cause the number of children per couple to go down to two. They are only favourable conditions. For the actual task of limiting the number of children to two, the couples must consciously do something—either on their own initiative or urged by the society.

—Saral Sarkar
Child marriage happens because adults believe they have the right to impose marriage upon a child. This denies children, particularly girls, their dignity and the opportunity to make choices that are central to their lives, such as when and whom to marry or when to have children. Choices define us and allow us to realize our potential. Child marriage robs girls of this chance. —Archbishop Desmond Tutu and Graca Machel
Of all the fantasies indulged in by a society speeding toward self-destruction, none is as consequential as the idea that continuing growth—both in size of population and size of economy—has a happy-ever-after ending. — Craig Durian
The command “Be fruitful and multiply” was promulgated, according to our authorities, when the population of the world consisted of two people. —William Ralph Inge
It is through the sheer mass of a mass society, not simply from malevolence, that the rising human tide has become deadly to the rest of life. The collective weight of a bloated humanity has dire ecological and social consequences. Every pressing problem, from poverty and malnutrition to biodiversity loss and climate change, is linked to human numbers and behavior. In aggregate, the prosaic actions of people—eating, manufacturing, polluting, shopping, warring—have made our species the functional equivalent of a geological force, able to affect even the global life support systems and climate in which our species evolved.
One of the great challenges today is the population explosion. Unless we are able to tackle this issue effectively we will be confronted with the problem of the natural resources being inadequate for all the human beings on this earth. . . . The only choice—limited number . . . happy life . . . meaningful life. Too many . . . miserable life and always bullying one another, exploiting one another. —His Holiness the Dalai Lama
The chief cause for the impending collapse of the world—the cause sufficient in and by itself—is the enormous growth of the human population: the human flood. —Pentti Linkola
The question of how many people the world can support is unanswerable in a finite sense. What do we want? Are there global limits, absolute limits beyond which we cannot go without catastrophe or overwhelming costs? There are, most certainly. —George Woodwell
We have geared the machines and locked all together into interdependence; we have built the great cities; now there is no escape. We have gathered vast populations incapable of free survival, insulated from the strong earth, each person in himself helpless, on all dependent. The circle is closed, and the net is being hauled in. They hardly feel the cords drawing... —Robinson Jeffers
Humans evolved in wild nature. Only relatively recently in our time on Earth, roughly ten to twelve millennia ago, did we begin to domesticate other species—and ourselves. That first agricultural revolution set humanity on a trajectory of population growth and settlement-based land use. Increased social organization and the invention of cities went hand in hand to allow development of increasingly complex economic and political systems. In 2008, for the first time in history, the majority of humans on Earth lived in cities. We had become, at least superficially, urban animals.
Faced with a world that can support either a lot of us consuming a lot less or far fewer of us consuming more, we’re deadlocked: individuals, governments, the media, scientists, environmentalists, economists, human rights workers, liberals, conservatives, business and religious leaders. On the supremely divisive question of the ideal size of the human family, we’re amazingly united in a pact of silence. —Julia Whitty
The problem of rapidly increasing numbers in relation to natural resources, to social stability and to the well-being of individuals—this is now the central problem of mankind. —Aldous Huxley
If our species had started with just two people at the time of the earliest agricultural practices some 10,000 years ago, and increased by 1 percent per year, today humanity would be a solid ball of flesh many thousand light years in diameter, and expanding with a radial velocity that, neglecting relativity, would be many times faster than the speed of light.

—Gábor Zovanyi
American suburbia represents the greatest misallocation of resources in the history of the world. The far-flung housing subdivisions, commercial highway strips, big-box stores, and all the other furnishings and accessories of extreme car dependence will function poorly, if at all, in an oil-scarce future. —James Howard Kunstler
Creation destroys as it goes, throws down one tree for another. But mankind would abolish death, multiply itself million upon million, rear up city upon city, save every parasite alive, until the accumulation of mere existence is swollen to a horror. —D.H. Lawrence
Squatters trade physical safety and public health for a few square meters of land and some security against eviction. They are the pioneer settlers of swamps, floodplains, volcano slopes, unstable hillsides, rubbish mountains, chemical dumps, railroad sidings, and desert fringes... Such sites are poverty’s niche in the ecology of the city, and very poor people have little choice but to live with disaster. —Mike Davis
Poor and populous countries, such as Pakistan, parts of India and much of Africa, are experiencing very rapid population growth, driven by a combination of high birth rates and falling death rates as development and aid reduce mortality. The consequence is that individuals and countries experience real difficulty in escaping their situation of grinding poverty as increasing populations compete for limited resources.

—Simon Ross
Not until man sees the light and submits gracefully, moderating his homocentricity; not until man accepts the primacy of beauty, diversity, and integrity of nature, and limits his domination and numbers, placing equal value on the preservation of natural environments as on his own life, is there hope that he will survive. —Hugh H. Iltis
Anyone who believes exponential growth can go on forever in a finite world is either a madman or an economist. —Kenneth Boulding
Human agriculture and industry are embedded in and supported by the natural ecosystems of Earth.... Yet modern societies heedlessly displace, poison, overharvest, and directly assault natural ecosystems with little thought for their importance in their own sustenance. —Paul and Anne Ehrlich
Megacities, gigantic concentrations of people and their artifacts, now dot multiple continents. Generally defined as urban agglomerations of more than 10 million people, megacities such as Tokyo, Delhi, Shanghai, and São Paulo are fueled by resources stripped from the far corners of the globe. The megacities of the developing world are often ringed by sprawling slums populated by people newly arrived from the countryside. Some may find economic opportunity; all will find crowding, congestion, and pollution.
Time and space—time to be alone, space to move about—they may well become the great scarcities of tomorrow. —Edwin Way Teale
In the last 200 years the population of our planet has grown exponentially, at a rate of 1.9% per year. If it continued at this rate, with the population doubling every 40 years, by 2600 we would all be standing literally shoulder to shoulder. —Stephen Hawking
We will find neither national purpose nor personal satisfaction in a mere continuation of economic progress, in an endless amassing of worldly goods. —Robert F. Kennedy
The immediate relief problems and earthquake casualties would be much less with a smaller population. The size of population now, with the scale of the problems it creates, leads to an increasingly chaotic situation. More population exacerbates any efforts needed to solve humanity’s problems, anywhere, be they immediate or long term. —Walter Youngquist
Unlike plagues of the dark ages or contemporary diseases we do not yet understand, the modern plague of overpopulation is soluble by means we have discovered and with resources we possess. What is lacking is not sufficient knowledge of the solution but universal consciousness of the gravity of the problem and education of the billions who are its victims. —Martin Luther King Jr.
Why, in heaven’s name, should anyone suppose that mere quantity of human organisms is a good thing, irrespective either of their own inherent quality or the quality of their life and their experiences? —Julian Huxley
The defining fact of this historical moment is the reality of exponential growth. —Lisi Krall
To live, every creature must eat. Supplying the food needs of 7 billion people has proven elusive thus far, despite dramatic intensification of agricultural production in the last century. The aggregate “footprint” of agriculture is massive: United Nations data suggest that some 5 billion hectares (more than 19 million square miles) of Earth’s land surface are used for croplands and livestock grazing. Despite that huge area converted from wild habitat to feed humankind, nearly a billion people are hungry and another billion persist tenuously, where a small shift in their circumstances would put them at risk of starvation. Across the globe, traditional village-scale agriculture—typically diversified and for local consumption—is being displaced by industrial monocultures grown for the export market. Irrigation is depleting aquifers and dewatering rivers. Livestock production is increasingly dominated by animal factories, concentrated animal feeding operations (CAFOs), which are an ecological and ethical tragedy.
Assimilation . . . proceeds by biotic cleansing and the impoverishment of others: using up the soil and poisoning it; putting the fear of God into the animals such that they cower or flee in our presence; renaming fish “fisheries,” animals “livestock,” trees “timber,” and rivers “freshwater” so as to conceptually ground the human enterprise’s extermination and commodification ventures. The impact of assimilation is relentless, and it is grounded in the experience of alienation and the attitude of entitlement. —Eileen Crist
We are slaves in the sense that we depend for our daily survival upon an expand-or-expire agro-industrial empire—a crackpot machine—that the specialists cannot comprehend and the managers cannot manage. Which is, furthermore, devouring world resources at an exponential rate. —Edward Abbey
Why should we tolerate a diet of weak poisons, a home in insipid surroundings, a circle of acquaintances who are not quite our enemies, the noise of motors with just enough relief to prevent insanity? Who would want to live in a world which is just not quite fatal? — Rachel Carson
Globalization, which attempts to amalgamate every local, regional, and national economy into a single world system, requires homogenizing . . . locally adapted forms of agriculture, replacing them with an industrial system—centrally managed, pesticide-intensive, one-crop production for export—designed to deliver a narrow range of transportable foods to the world market. —Helena Norberg-Hodge
We stand, in most places on earth, only six inches from desolation, for that is the thickness of the topsoil level upon which the entire life of the planet depends. — R. Neil Sampson
Despite the industry’s spin, CAFOs (concentrated animal feeding operations) are not the only way to raise livestock and poultry. Thousands of farmers and ranchers integrate crop production, pastures, or forages with livestock and poultry to balance nutrients within their operations and minimize off-farm pollution through conservation practices and land management. Yet these sustainable producers, who must compete with factory farms for market share, receive comparatively little or no public funding for their sound management practices. —Martha Noble
The principle of confinement in so-called animal science is derived from the industrial version of efficiency. The designers of animal factories appear to have had in mind the example of concentration camps or prisons, the aim of which is to house and feed the greatest numbers in the smallest space at the least expense of money, labor, and attention. To subject innocent creatures to such treatment has long been recognized as heartless. Animal factories make an economic virtue of heartlessness toward domestic animals, to which we humans owe instead a large debt of respect and gratitude.

—Wendell Berry
The billions of animals that are slaughtered and disassembled each year throughout the factory farm system are viewed as little more than profitable commodities and production units... This mechanistic mindset about farm animals is even encoded in our laws. The important protections against cruelty and mistreatment in our federal Animal Welfare Act apply to pets, exhibition animals, and research animals, but not to our farm animals. —Andrew Kimbrell
The greatness of a nation and its moral progress can be judged by the way its animals are treated. —Mohandas K. Gandhi
In ecology, the term overshoot describes the phenomenon of a species becoming so numerous that it outstrips its habitat. Overshoot leads to diminished carrying capacity, typically followed by a population crash. It is widely acknowledged by ecologists that humanity has overshot the carrying capacity of Earth and is drawing down the “natural capital” that the ecosphere provides. Poverty and malnutrition may be indicators of ecological overshoot. War, corruption, cultural legacies such as colonialism, and other factors certainly contribute to famine and other social problems, but one can clearly see overshoot in the degraded landscapes where humanity has eliminated wild nature and reduced the land’s productivity. It is also evident in depleted stocks of formerly abundant fish, and in the faces of hungry children.
Throughout history human exploitation of the earth has produced this progression: colonize—destroy—move on. —Garrett Hardin
Any area of land will support in perpetuity only a limited number of people. An absolute limit is imposed by soil and climatic factors in so far as these are beyond human control, and a practical limit is set by the way in which the land is used. If this practical limit of population is exceeded, without a compensating change in the system of land usage, then a cycle of degenerative changes is set in motion which must result in deterioration or destruction of the land and ultimately in hunger and reduction of the population. —William Allan
A population and economy are in overshoot mode when they are drawing resources or emitting pollutants at an unsustainable rate, but the stresses on the support system are not yet strong enough to reduce the rates of withdrawal or emission. Overshoot comes from delays in feedback—from the fact that decision makers in the system do not get, or believe, or act upon the information that limits have been exceeded until long after they have been exceeded. —Donella Meadows, Dennis Meadows, and Jørgen Randers
Too many people brings suffering to the land, and the land returns its suffering to the people. —O. Soemarwoto
In absolute numbers, more illiterate, impoverished, and chronically malnourished people live in the world at the end of the twentieth century than at the beginning. —Marvin Harris
The sheer volume of raw materials that must be mined, refined, processed, transported, manufactured into products to service billions of people (and eventually disposed) almost defies imagination. It is not, however, incalculable. Efforts to gather such data have become increasingly sophisticated and, when combined with various assessments as part of “ecological footprint” analysis, can offer a broadly representative picture of humanity’s global impact. The picture isn’t pretty. From cradle to grave, as raw materials are transformed into products, this process of “material throughput” causes ecological damage. Behind that damage to the Earth is the idea of perpetual economic growth being synonymous with progress. In the overdeveloped world, a ubiquitous advertising industry fuels an ethic of hyperconsumption. In the developing world, the grave problems of poverty and social inequity are frequently met not with programs to strengthen traditional community structures but with ill-conceived efforts to “modernize” and to turn citizens into participants of an ever-expanding, global consumer society.
This attempt to “green” the industry . . . somehow, they can convince young people not just to consume but to consume more responsibly; that’s the latest idea that the advertising industry has come up with to save themselves. . . . There is a fundamental contradiction that they still haven’t come to grips with. And that fundamental contradiction is that we don’t need to consume any more, we don’t need a five-hundred billion- dollar-a-year industry telling us to consume more. We already consume enough. —Kalle Lasn
In the developing world, the problem of population is seen less as a matter of human numbers than of Western overconsumption. Yet within the development community, the only solution to the problems of the developing world is to export the same unsustainable economic model fueling the overconsumption of the West.” —Kavita Ramdas
That which seems to be wealth may in verity only be the gilded index of far-reaching ruin. —John Ruskin
Consumerism is not an ahistorical trait of human nature but a specific product of capitalism. —Juliet B. Schor
There are some things in the world we can't change—gravity, entropy, the speed of light, and our biological nature that requires clean air, clean water, clean soil, clean energy and biodiversity for our health and wellbeing. Protecting the biosphere should be our highest priority or else we sicken and die. Other things, like capitalism, free enterprise, the economy, currency, the market, are not forces of nature, we invented them. They are not immutable and we can change them. It makes no sense to elevate economics above the biosphere. —David Suzuki
Some people continue to defend trickle-down theories which assume that economic growth, encouraged by a free market, will inevitably succeed in bringing about greater justice and inclusiveness in the world. This opinion, which has never been confirmed by the facts, expresses a crude and naïve trust in the goodness of those wielding economic power and in the sacralized workings of the prevailing economic system. Meanwhile, the excluded are still waiting. To sustain a lifestyle which excludes others, or to sustain enthusiasm for that selfish ideal, a globalization of indifference has developed. —Pope Francis
An increasingly globalized industrial economy strips raw materials from every corner of the globe, delivers them where manufacturing or processing costs are cheapest, and ships the resulting products to distant markets. This economic activity, crisscrossing the Earth in a web of transport routes, is based on abundant cheap energy. Every step generates waste—some of which is dumped into the atmosphere as air pollution; some into local waterways; some into the ground. A culture that treats the Earth as a commodity, as merely a storehouse of resources for human use, is a throwaway culture producing throwaway stuff. That culture’s legacy is the endless stream of solid waste—trash—that ends up heaped in landfills, scattered across the landscape, or adrift in massive trash gyres at sea.
Put simply, if we do not redirect our extraction and production systems and change the way we distribute, consume, and dispose of our Stuff—what I sometimes call the take-make-waste model—the economy as it is will kill the planet. —Annie Leonard
Since survival is nothing if not biological... perpetuating economic or political institutions at the expense of biological well-being of man, societies, and ecosystems may be considered maladaptive. —Roy Rappaport
The hungry world cannot be fed until and unless the growth of its resources and the growth of its population come into balance. Each man and woman—and each nation—must make decisions of conscience and policy in the face of this great problem.

—Lyndon B. Johnson
Even as a waste disposal site, the world is finite. —William R. Catton Jr.
The laws of thermodynamics restrict all technologies, man’s as well as nature’s, and apply to all economic systems whether capitalist, communist, socialist, or fascist. We do not create or destroy (produce or consume) anything in a physical sense—we merely transform or rearrange. And the inevitable cost of arranging greater order in one part of the system (the human economy) is creating a more than offsetting amount of disorder elsewhere (the natural environment). —Herman E. Daly
Water and air, the two essential fluids on which all life depends, have become global garbage cans. —Jacques-Yves Cousteau
Five deep contractions in life’s diversity are recorded in the fossil record, the last occurring 65 million years ago when the dinosaurs went extinct. Those previous mass extinction events were all precipitated by natural causes. The sixth, and current, great extinction is caused by humanity’s destruction of intact habitat, overkilling of wildlife, and climate disruption. Nature’s death is by a thousand cuts—from deforestation, livestock overgrazing, conversion of wild habitat to agriculture, industrial development, mining, pollution, spread of invasive species, energy extraction in myriad forms, etc. The cuts come from many blades, but the result is the same: biological impoverishment as ecosystems are degraded and native species are lost. Moreover, each of these nicks on nature represents the loss of wild beauty. Because humanity depends on healthy ecosystems for clean air and water, fertile soil, and pollination services, the unraveling of nature should alarm every human being on Earth.
The “poster child” for negative impacts from biofuel production is palm oil biodiesel. Greenhouse gas emissions from the conversion of Asia’s lowland peat forest into palm oil plantations are astronomical, accounting for nearly 8 percent of the global total. —Rachel Smolker
Human domination over nature is quite simply an illusion, a passing dream by a naive species. It is an illusion that has cost us much, ensnared us in our own designs, given us a few boasts to make about our courage and genius, but all the same it is an illusion. —Donald Worster
In an interconnected world, the decision to bear a child isn’t only a personal matter, nor does it pertain only to one’s moment. Won’t even the wanted, cared-for children feel betrayed to discover (assuming that such thoughts are still thinkable in the future) that previous generations ignored the problem of overpopulation and dodged the difficult choices in favor of a comfortable, conventional existence whose price included migratory songbirds, large mammals, old-growth forests, and polar ice shelves?—Stephanie Mills
I don’t understand why when we destroy something created by man we call it vandalism, but when we destroy something created by nature we call it progress. — Ed Begley, Jr.
Do you think you can take over the universe and improve it? I do not believe it can be done. The universe is sacred. You cannot improve it. If you try to change it, you will ruin it. —Lao Tsu
Our primordial spontaneities, which give us a delight in existence and enable us to interact creatively with natural phenomena, are being stifled. Somehow we have become autistic. We don’t hear the voices. We are not entranced with the universe, with the natural world. We are entranced instead with domination over the natural world, with bringing about violent transformation. —Thomas Berry
If you’re overfishing at the top of the food chain, and acidifying the ocean at the bottom, you’re creating a squeeze that could conceivably collapse the whole system. —Carl Safina
Humanity’s burgeoning numbers and selfish behavior now being the cause of the other species’ extinction is the clearest marker that our present course is both unsustainable and unethical. Even while 95 percent of scientifically described species have yet to be analyzed for their conservation status, the IUCN (International Union for Conservation of Nature), which tracks the status of imperiled species around the globe, lists some 20,000 species that are threatened with extinction. Given the relative paucity of data about various groups of organisms, the actual number of species on the cusp of oblivion is certainly far larger, and numerous scientific studies have noted the accelerating trend of biodiversity loss. Humanity’s assault on wildlife isn’t new, but 7+ billion people armed with advanced technology—from bottom-scouring trawlers that mine the seas of fish, to endocrine-disrupting chemicals that affect wild species’ reproductive success, to violent poachers decimating elephants for their ivory tusks—are simply more lethal to wildlife now than at any point in human history.
The massive growth of the human population through the 20th century has had more impact on biodiversity than any other single factor. —Sir David King
There is a terribly terrestrial mindset about what we need to do to take care of the planet—as if the ocean somehow doesn’t matter or is so big, so vast that it can take care of itself, or that there is nothing that we could possibly do that we could harm the ocean...We are learning otherwise.

—Sylvia Earle
Except for giant meteorite strikes or other such catastrophes, Earth has never experienced anything like the contemporary human juggernaut. We are in a bottleneck of overpopulation and wasteful consumption that could push half of Earth’s species to extinction in this century. —E. O. Wilson
A country can cut down its forests, erode its soils, pollute its aquifers and hunt its wildlife and fisheries to extinction, but its measured income is not affected as these assets disappear. Impoverishment is taken for progress. —Robert Repetto
The mountain gorilla faces grave danger of extinction, primarily because of the encroachments of native man upon its habitat—and neglect by civilized man, who does not conscientiously protect even the limited areas now allotted for the gorilla's survival. —Dian Fossey
Less than 3,000 tigers (Panthera tigris) now occur in the wild, occupying less than 7 percent of their historical range . . . With the tiger we are witnessing the tragic winking out of one of the planet’s most beloved animals across its range, one population at a time. —Elizabeth L. Bennett
In the relations of man with the animals, with the flowers, with the objects of creation, there is a great ethic, scarcely perceived as yet, which will at length break forth into the light and which will be the corollary and complement to human ethics. — Victor Hugo
We need another and a wiser and perhaps more mystical concept of animals... They are not brethren, they are no underlings; they are other nations, caught with ourselves in the net of life and time, fellow prisoners of the splendor and travail of the earth.

—Henry Beston
Surely the fate of human beings is like that of the animals; the same fate awaits them both: As one dies, so dies the other. All have the same breath... —Bible, Ecclesiastes 3:19
Perhaps we can adapt to global warming, and perhaps we can survive a mass extinction even of species on land. But I know one thing to be an ecological certainty and that is if we kill the oceans—we kill ourselves. —Captain Paul Watson
Of the 250,000 species of plants that share our world, three quarters rely on wild pollinators to reproduce. Wherever you live, look around and see a world engineered by these pollinators. Then look around and see a world in distress. Honeybees may have been filling in for wild pollinators to bolster our agriculture, but they can't do much for the other 249,900 species of flowering plants. That's up to the native bugs. And while evidence is hard to come by, many of these species are failing under the triple threats of habitat loss, pesticide poisoning, and exotics. —Rowan Jacobsen
Modern, techno-industrial society runs on energy—massive amounts of inexpensive, continuously available power generated primarily from fossil fuels. Around 1800, at the dawn of the Industrial Revolution, the global human population was roughly 1 billion. It had taken our entire lifetime as a species to reach that milestone. In the subsequent two centuries, the human population has grown more than sevenfold, and energy use per capita has increased by more than thirty times. Clearly, as a species we have gotten tremendously clever at deploying energy resources to support population and economic growth. But at what cost? The energy sector likely affects a greater area than any other activity except agriculture. It seems there is nothing we won’t do, no landscape too precious to exploit for energy production. Even as landscapes across the globe are blighted in the mad rush for more energy to fuel growth, billions of people on Earth still have little or no access to energy resources that could improve their health and prospects for the future.
In many ways, the world’s coal reserves only make our energy problems worse, because they give us a false sense of security: if we run out of gas and oil, we can just switch over to coal; if we can figure out a way to “clean” coal, we can have a cheap, plentiful source of energy. In reality, however, facing the twin challenges of the end of oil and coming of global warming is going to require reinventing the infrastructure of modern life. The most dangerous thing about our continued dependence on coal is not what it does to our lungs, our mountains, and even our climate, but what it does to our minds: it preserves the illusion that we don’t have to change our thinking. — Jeff Goodell
In Southern West Virginia we live in a war zone. Three and one-half million pounds of explosives are being used every day to blow up the mountains. Blasting our communities, blasting our homes, poisoning us, trying to intimidate us. I don’t mind being poor. I mind being blasted and poisoned. There are no jobs on a dead planet. — Judy Bonds
The environmental crisis can be viewed as a tree with two trunks. One trunk represents what we are doing to the planet through atmospheric accumulation of heat-trapping gases. Follow this trunk along and you find droughts, floods, acidification of oceans, dissolving coral reefs, and species extinctions. The other trunk represents what we are doing to ourselves and other animals through the chemical adulteration of the planet with inherently toxic synthetic pollutants. At the base of both these trunks is an economic dependency on fossil fuels, primarily coal (plant fossils) and petroleum (animal fossils). —Sandra Steingraber
Destroying wild rivers with large dams in order to generate electricity is one of the clearer examples of a false solution to humanity's "need" for energy. Modernity has unnecessarily inflated this need; given the severe negative environmental impacts of electricity generation in general, it is amazing how superfluously and frivolously this form of energy is utilized. At this point in human history, our capacity to have blind spots regarding truly life-or-death issues has become one of our most prominent traits. – Juan Pablo Orrego
All of our current environmental problems are unanticipated harmful consequences of our existing technology. There is no basis for believing that technology will miraculously stop causing new and unanticipated problems while it is solving the problems that it previously produced. —Jared Diamond
We have reached a point of crisis with regard to energy, a point where the contradictions inherent in our growth-based energy system are becoming untenable, and where its deferred costs are coming due. The essential problem is not just that we are tapping the wrong energy sources (though we are), or that we are wasteful and inefficient (though we are), but that we are overpowered, and we are overpowering nature. —Richard Heinberg
So the big question about nuclear "revival" isn't just who'd pay for such a turkey, but also... why bother? Why keep on distorting markets and biasing choices to divert scarce resources from the winners to the loser—a far slower, costlier, harder, and riskier niche product—and paying a premium to incur its many problems? —Amory Lovins
Water is life. Without it, we perish. Clean water and healthy seas are fundamental to the future welfare of humanity, and yet the industrial growth economy wastes copious amounts of water and treats the living oceans as a dumping ground for our effluent. This disdain may stem, at least in part, from an old myth—the idea that the seas were limitless and their abundance immune to the efforts of people. That may have been true when we were few and our tools were simple. It is not true today when we are overabundant and no part of the ocean is out of reach of industrial fishers. The aggregate demands of a bloated humanity on freshwater systems leave less and less room for nature and put billions of people at risk of having inadequate drinking water.
Good water, good life. Poor water, poor life. No water, no life. —Sir Peter Blake
If there is magic on this planet, it is contained in water. —Loren Eiseley
Think of Alberta as the Nigeria of the North. (Well, there are a lot more white people in Alberta, and Canada’s military hasn’t killed anybody to protect the oil business.) Both economies have been increasingly dominated by oil. In 2009 Nigeria exported around 2.1 million barrels of oil per day; Canada exported 1.9 million barrels per day. Environmental regulation of the oil industry in both Nigeria and Alberta is lax, and the industry has been actively opposed by Native people—the Ogoni, in particular, in Nigeria and the Cree in Alberta. —Winona LaDuke and Martin Curry
We have traditionally regarded sin as being merely what people do to other people. Yet, for human beings to destroy the biological diversity in God’s creation; for human beings to degrade the integrity of the earth by contributing to climate change, by stripping the earth of its natural forests or destroying its wetlands; for human beings to contaminate the earth’s waters, land and air—all of these are sins. —Ecumenical Patriarch Bartholomew, Head of the Greek Orthodox Church
Although biologists are at a loss to explain the most recent algae bloom, scientists suspect it is connected to pollution and increased seaweed farming... While similar green tides have been reported around the world, the annual bloom in the Yellow Sea is considered the largest, growing to an estimated million tons of biomass each year. —Andrew Jacobs
We must realize that not only does every area have a limited carrying capacity—but also that this carrying capacity is shrinking and the demand growing. Until this understanding becomes an intrinsic part of our thinking and yields a powerful influence on our formation of national and international policies we are scarcely likely to see in what direction our destiny lies. —William Vogt
The air pollution and greenhouse gas emissions that are dumped into the global atmosphere at no cost to the polluters are, in the lexicon of economics, “externalities.” The reality of course is that we all pay in the end through shortened lives, increased health care expenses, and the quickly rising ecological and social costs of a disrupted climate. A universal human experience is to look skyward at the heavens and to feel a sense of wonder. With the very atmospheric chemistry of the planet altered by our polluting, fossil fuel-based energy economy, will future generations look skyward with hope or with fear?
In a few decades, the relationship between the environment, resources, and conflict may seem almost as obvious as the connection we see today between human rights, democracy and peace. —Wangari Maathai
Air pollution (and its fallout on soil and water) is a form of domestic chemical and biological warfare. —Ralph Nader
Most men, it appears to me, do not care for Nature, and would sell their share in all her beauty, for as long as they may live, for a stated and not very large sum. Thank God they cannot yet fly and lay waste the sky as well as the earth. We are safe on that side for the present. It is for the very reason that some do not care for these things that we need to combine to protect all from the vandalism of the few. — Henry David Thoreau (1862)
We run heedlessly into the abyss after putting something in front of us to stop us from seeing it. —Blaise Pascal
Global climate change may be the purest expression of humanity’s toxic effect on the biosphere. The unintended consequence of fossil fuel use and habitat destruction (especially of natural carbon-sequestering forests and grasslands), climate change is now observable, is measureable, and portends to get much worse. Steadily rising global temperature and accelerating greenhouse-gas emissions should be a clarion call to action. A few governments have heard that call and are seriously attempting to become carbon-neutral nations; most are dithering and some are actively obstructing collective climate solutions. Almost no one in a position of influence forthrightly makes the common sense linkage between overpopulation and climate change, noting the impossibility of solving the climate crisis without stabilizing, and then beginning to reverse, the human demographic trajectory.
Prophesying catastrophe is incredibly banal. The more original move is to assume that it has already happened. —Jean Baudrillard
There are many ways in which we wound wild Earth and kill wild things. But behind them all is Man swarm—our population boom. Even in the short run, we cannot keep wilderness and wildlife without stopping Man’s growth. Furthermore, it is nothing less than a lie we tell ourselves that we can stop climatic weirdness without lowering how many we are on the Earth. —Dave Foreman
The effect of climatic disruption now gathering momentum is a tsunami of change that will roll across every corner of the Earth, affect every sector of every society, and worsen problems of insecurity, hunger, poverty, and societal instability. —David Orr
The island is full of holes and seawater is coming through these, flooding areas that weren’t normally flooded 10 or 15 years ago. There are projections of about 50 years [before the islands disappear]. After this, we will be drowned. —Paani Laupepa
The Arctic situation is snowballing: dangerous changes in the Arctic derived from accumulated anthropogenic greenhouse gases lead to more activities conducive to further greenhouse gas emissions. This situation has the momentum of a runaway train. —Carlos Duarte
Public infrastructure around the world is facing unprecedented stress, with hurricanes, cyclones, floods and forest fires all increasing in frequency and intensity. It’s easy to imagine a future in which growing numbers of cities have their frail and long-neglected infrastructures knocked out by disasters and then are left to rot, their core services never repaired or rehabilitated. —Naomi Klein
What has become clear from the science is that we cannot burn all of the fossil fuels without creating a very different planet. —James Hansen
LORD MAN

PARABLE REDUX

Facing the stark choice to continue his futile quest to bend the Earth to his will…
or to rejoin the community of life, Lord Man renounced the goal of empire, and was no more.

People around the globe began to remember the old ways, before humans behaved as if the Earth was merely a storehouse of resources for them.
The people looked to the landscapes around them to inform their culture and shape their ways of living.

They valued the other members in the land community, giving them space enough to flourish in their own ways.
Knowledge and tools for family planning were universally shared. People began to restrain their numbers, with smaller families becoming a key to societal well being.
Children were allowed to be children, not forced into marriages with adults.

All the children were loved, and all were encouraged to follow their dreams.
Development priorities began to shift from more to better. Economic objectives shifted toward sustainability, sufficiency, and resilience.
Actions were judged ethical or not by whether they helped sustain beauty, biodiversity, and health.

The people chose lives of quality, with sufficient time for the activities and relationships that gave them joy.
Eventually the people forgot the dark days when they'd sought to rule, and they honored their new relationship with the Earth.

Whales, unmolested, sang in the deep.
The sounds of leaves rustling and children laughing settled over the land, and the tree of life grew toward the sky.
ONE OF THE COMMONPLACES of environmental writing these days is a population forecast of 10 billion (or more) people by century’s end. Indeed, this projection is endlessly repeated, as if it were as inevitable as the calculable trajectory of an asteroid hurtling through space. Besides being a facile meme amenable to replication, this recurrent demographic report signals a widely shared fatalism: The coming growth has too much inertia behind it, and is far too politically sensitive, to question. At the same time, the projection reinforces a collective impression that nothing can be done to change it. Ironically, the incantation of “10 billion” seems at work as self-fulfilling prophecy, for without concerted, proactive intervention it is roughly the number to be expected; so do we hypnotize and propel ourselves in the predicted direction.

Environmental analysts have divergent responses to this particular figure (which is the latest United Nations estimate). Some are incredulous that such a number can be approached—let alone sustained—and contend that the consequences of moving in that direction will be disastrous; a catastrophe or combination of catastrophes is bound to derail professional demographers’ expectations, and humanity (after enduring much suffering, or perhaps experiencing some kind of wake-up call) will stabilize at lower numbers. But other environmental observers, describing themselves as more optimistic, are endeavoring to figure out strategies that might sustain the expected billions. They hope that with the right developments and innovations in crop genetics, irrigation technologies, fertilizer application (“responsible nutrient management”), efficiency gains (including closing “yield gaps” and curbing food waste), requisite energy transitions, and other advances, the planet might feed, provide water for, house, educate, and medicate—at an acceptable standard of living for all—the coming 10. There is reason to wager, they maintain, that humanity might succeed at the task, since people are resourceful, determined, and apt to get out of a tight spot even in the nick of time.

Thus where some see disaster on the immediate horizon, others submit that with another techno-managerial turn of the screw humanity might avert grim penalties to population growth. Yet despite considerable divergence in outlook, all environmental analysts agree that (even as our global numbers continue to climb) we face grueling challenges, each immense in its own right but dizzying in their unpredictable synergies: biodiversity destruction, climate change, freshwater depletion, ceilings on agricultural productivity, all manner of pollution, topsoil loss, and ocean acidification to mention some prominent examples.

Rather than taking sides between the forecast of impending tragedy versus optimism about “feeding the world,” there is another way to tell the near future’s story. On that telling, the issue is not whether it is possible for 10 billion people to eat industrial food, commune with iPhones, and make a decent living on planet Earth (an outriding scenario, in my view, but perhaps stranger things have happened in the universe). The point to focus on instead is that a world of so many billions does not, in any case, turn out well: Because such a world is only possible by taking a spellbindingly life-abundant planet and turning it into a human food plantation, grided with industrial infrastructures, webbed densely by networks of high-traffic global trade and travel, in which remnants of natural areas—simulacra or residues of wilderness—are zoned for ecological services and ecotourism. In such a world, cruise ships with all-you-can-eat buffets will circumnavigate seas stripped of their plenitude of living beings, on waters awash with plastic refuse decomposing into bite-sized and eventually microscopic particles destined for incorporation into the worldwide food web.

What’s more, a sustainable geopolitical status quo of 10 billion consumers will require comprehensive megatechnological support: offshore dike projects; more dams (already, according to a 2009 Yale Environment 360 report, being constructed at “a furious pace”); desalination plant construction with...
accompanying transport infrastructures; scaling-up of industrial aquaculture; genetic modification of crops and animals to adapt to climatic and consumer demands; cultivating so-called marginal lands to grow grasses and other plants for biofuels; the spread of the fracking scourge (globalizing “the oil and shale-gas boom”); climate engineering at global and regional scales; and the spread and normalization of factory farms. (The Economist graces the efficiency of the latter institution over traditional husbandry, calling it—apparent oblivious of the term’s Orwellian malodor—“the livestock revolution.”) In such a world corporations are likely to continue reigning supreme, for the coming technological gigantism (not to mention the escalation of mass consumption) will make them indispensable. Corporate expertise and products will be required to keep the biosphere on permanent “dialysis,” to borrow a fitting metaphor from James Lovelock. Corporations will continue generating enormous revenues, via tax-based subsidies for their “public works” and by catering their products to huge numbers of people. (Any doubt regarding the relationship between private-sector opulence and consumer population size is dispelled by taking note of the correlation between today’s wealthiest companies and their bulging middle-class client base. Indeed, capitalism is quite partial to the twin perks of population growth: cheap labor and mass clientele.) Whatever relative natural places remain will be slated as the real estate and vacation destinations of the most affluent—as they are to a large degree today. But regardless of whether or not corporations and the gilded class entrench their reign, everyone (including the rich) will be wretchedly dispossessed, hustling for happiness on a planet degraded to serve a bloated, user-species.

In the “interdisciplinary” dance of Life—where phenomena of physics, organismal biology, biochemistry, behavior, awareness, and chaos jut in established and spontaneous patterns—Life creates abundance. For example, hundreds of millions of eggs wash to the sea’s edge, feeding multitudes before a fraction of what they are: the elegant way home and the surest means for expressing the biosphere freedom to express its ecological and evolutionary arts. For that, we in turn need to cultivate the breadth of imagination to give the concept of freedom wider scope—pushing its territory beyond the sheath of human exclusivity. In the name of a higher freedom that encompasses Earth and its entire community of beings, we can choose to let the world be the magnificence and life it was and still can be. Borrowing words from nature writer Julia Whitty’s Deep Blue Home, this path is about cultivating intimacy with the natural world, taking as our lover the way things pass away in their relevant contexts. The Life-world itself is far more encompassing in the kinds of phenomena it manifests and cannot be reduced to a one-dimensional schema. Except for the one thing we know in the marrow of our bones and in our hearts: that the Life-world is All-good.

And here’s the crux of the matter: Humanity can choose to live on a planet of Life instead of hopelessly ploughing toward a human-colonized planet on dialysis (loosely managed). To live on a planet of Life it is necessary to limit ourselves so as to allow the biosphere freedom to express its ecological and evolutionary arts. For that, we in turn need to cultivate the breadth of imagination to give the concept of freedom wider scope—pushing its territory beyond the sheath of human exclusivity. In the name of a higher freedom that encompasses Earth and its entire community of beings, we can choose to let the world be the magnificence and life it was and still can be. Borrowing words from nature writer Julia Whitty’s Deep Blue Home, this path is about cultivating intimacy with the natural world, taking as our lover the way things pass away in their relevant contexts.

But the wisdom of limitations—of our numbers, economies, and places of habitation—is rarely entertained in mainstream thought for what it is: the elegant way home and the surest means for addressing the deepening (and likely self-endangering) problems of extinctions, ecosystem destruction and simplification, rapid climate change, freshwater and topsoil depletions, as well as (easily) mounting concerns about “feeding the world.” The path of limitations is rarely entertained, for it is assumed to be unrealistic and thus politically inexpedient. But knowledge of the multiple stresses on the biosphere, along with an understanding of the adverse, volatile ways these may compound one another, yield the recognition that drastically scaling down the human project is the most realistic approach to imminent catastrophes. If political expediency cannot see that, then political expediency and those who speak for it need to be deposed so we can get on with the real work.

IN THE MEANTIME, even as the available option of limitations is bypassed as ostensibly unrealistic, the prevailing question voiced with increasingly shrill urgency is: Can the Earth feed 10 billion people? By most expert accounts, because of population growth along with the rise of meat and animal product consumption, food production will have to double by 2050 to meet demand—and the big question is: Can it be done? There is an effort under way to figure this out, by experimenting in research and development labs, working in research stations, and analyzing agricultural databases. And because it is well known that most (and certainly the most fertile) arable lands are already in cultivation, and that the areas where wild creatures live are already pushed to their limits, the effort to increase food production (to double it in about forty years and triple it by the century’s end) is invariably eschorted by the caveat that it must be done without “further damage to biodiversity” or “taking over more uncultivated lands.”

Since at least the early 2000s, this “ecologically correct” sound bite has been activated in environmental writings, journalistic reports, and corporate web pages: We must produce more crops (for food, feed, and fuel), as well as more meat and animal products, by means of careful planning and management, with minimal additional ecological impacts. Oddly, the latter disclaimer is stated as if tropical forests are not today giving way to soybean monocultures, cattle ranches, and oil palm, sugar, tea, and other plantations; as if large-scale acquisitions recruiting land (in Africa and elsewhere) are not already under way in the name of “food security”; as if marine life is not being chewed up by the industrial machines; and as if rivers are not today so taxed by damming, extraction, diversion, and pollution that the crisis of freshwater Life may well be the greatest extinction site on Earth (a big noxious as far as the public and its elected officials are concerned). Despite all these things happening already today (in a global economy of 73 billion), those at work to figure out if food
demographic growth reveals a profound lack of insight into the bigger picture of what stretching our food-producing capacity has really portended. It reveals an inability to appreciate—or even to entertain as a passing thought—that human carrying capacity (how many people the Earth can support!) has been extended not simply because we are so clever at manipulating natural processes and inventing stuff, but through forcefully taking over the carrying capacity of other life-forms and, in the process, wiping them out regionally or globally. Moreover, the exemptionalist thereby displayed—that we are not bound by natural conditions like other species—betrays the superficial “fact” that it seems to be, serves conveniently as an ideological hardmaid of human expansionism. For what the doctrine of exemptionalism tacitly conveys and inculcates is that because humanity is so special by comparison to all other creatures, it is proportionately that much more entitled; and thus the acts of war on the natural world that undergird our expansionism (for food production in particular) become unrecognizable as acts war.

The question of whether ultimately there are (or not) natural limits to our food-producing ability, which will (or not) check human demographic growth is not so interesting; the experiment required for the final verdict is an ugly one either way. Instead, I along with other deep ecologist’s invites consideration of something far more enticing: that by choosing the wisdom of limitations and humility, we could meet them). Food production drives soil erosion and desertification, giving rise to oceans-spanning dust storms. It also depends on constant applications of pesticides, herbicides, and other biocides: Indeed, many consumers and growers, alike, have been duped by corporate salesmen (and their government allies) into believing that it is normal and necessary to poison the biosphere for the purpose of producing human nourishment. Streams, rivers, lakes, wetlands, and estuaries around the world are fouled or deadened by agricultural runoff and farm animal excrement—all just “how things have to be” if we are to eat.

This unprecedented impact on the living world allows for the production of so much food as to seemingly demonstrate our ability to feed billions and, with some additional resourcefulness, perhaps feed even more. From a deep ecological perspective,
however, the unprecedented ecological impact demanded for the production of so much food has demonstrated our capacity to take a magnificent plant—second to none in the known universe—and turn it into, or use it as, a human feedlot, and then muster the arrogance to call this act of pillage and degradation an “achievement.”

In his latest work, Countdown, author Alan Weisman sums our current Green Revolution food system as involving “fossil fuel gluttony,” “river fouling fertilizers,” “dependence on poisons,” and “monocultural menace to biodiversity.” So how is the amount of food we produce to be doubled or more without additional damage? Remarkably, one of the strategies being considered is to extend the productivity of Green Revolution methodologies to places they have not yet reached. Indeed, as the global population continues to grow, spreading the Green Revolution in order to “feed the world” will be the likely tack of the present-day policy framework, which is beholden to (in no particular order) corporate interests, institutional inertia, and acute anthropocentrism. Predictably, the call to extend the Green Revolution is cushioned by all the ecologically correct pleas for wiser uses of water, more efficient application of pesticides and herbicides, inclusion of no-till agriculture, and so forth. It is little wonder that the call to extend the Green Revolution is met with the same response as any call for change: “It is not the model make good. At best it yields a world—as Rachel Carson so cuttingly put it—that is not quite lethal.”

I HAVE DIGESTED into the ecological discontents of humanity’s current food production in order to submit the following: that the social mission to double or triple it is madness. But the proposal to move deliberately in the direction of more violence and harm will make possible the radical transformation of an industrial food system that is currently bequeathing ecologies, wild and domestic animals, and human wellness. (Four leading causes of disease and death are linked to industrial food, and especially to the consumption of mass-produced, low-quality animal products: heart disease, diabetes, cancer, and stroke.) The whole world can indeed be fed with organically grown, nutritious food, by prioritizing local and regional food economies, without mining, polluting, and dispersing the soil but by caring for it and building it; through diversified, smaller-scale farm operations modeled on natural ecosystems; in lovely and fecund interfaces with wild nature (‘farming with the wild’); and by forsaking high quantities of animal foods, for the occasional consumption of such foods produced with due consideration to ethical and nutritional values. This wholesome turn only becomes possible if our global numbers are far lower than today’s.

We need an authentic green revolution. Instead of holding demographic growth as given, and a biosphere-wrecking food system as normal, let’s imagine what the world might look like if we renounced both. And if the world would look more beautiful and sane with expansive rewilding; with abundant food, ecologically and ethically produced; with streams, rivers, lakes, and estuaries returned to being living waters; with deforestation halted and grassland ecologies reestablished; with the extinction crisis arrested and seas thriving again with life; and with climate change made more manage able via carbon-sequestering forests and grasslands and decelerated emissions. If all these things can be achieved, what is keeping us from pursuing such a world? Indeed, what is detaining us from creating a civilization in harmony with wild Earth?

Visit the Global Population Speak Out website to add your voice and lend support to a worldwide campaign of activists, population and development professionals, and ordinary citizens concerned about the enormous size and rapid growth of the human population—and how these issues affect both the future of people and the ability of other species to flourish. The "Speak Out" is the planet’s leading population advocacy platform, bridging continents, cultures, and languages to bring together a global community of motivated and concerned citizens. Right now, future human population dynamics are being decided. Your voice, your spirit, and your creativity can be the difference between a stabilized and more sustainable human population by mid-century or one that is still rapidly expanding, unsustainably, by the millions.

Join us: populationspeakout.org.

Population Media Center (PMC) is a nonprofit, international nongovernmental organization, which strives to improve the health and well-being of people around the world through the use of entertainment-education strategies, such as serialized dramas on radio and television, in which characters evolve into role models for the audience for positive behavior change. Founded in 1998, PMC has over 15 years of field experience using the Sabido methodology of behavior change communications, positively affecting more than 50 countries around the world.

www.populationmedia.org

The Population Institute (PI) provides essential leadership to promote voluntary family planning and reproductive health services and increased awareness of the social, economic, and environmental consequences of rapid population growth. Founded in 1969 and based in Washington, DC, PI works to educate policymakers, the media, and the general public about population issues. PI also recruits and trains tomorrow’s population activists, and national membership networks to address population issues. The Institute promotes both international and U.S. support for voluntary family planning programs, and supports fullequal, political, economic and social equality for women, including sexual and reproductive rights.
